Structure

Background

Leukotriene B₄ (LTB₄) promotes a number of leukocyte functions including aggregation, stimulation of ion fluxes, superoxide anion production, chemotaxis, and chemokinesis. Two G protein-coupled receptors, BLT1 and BLT2 mediate the actions of LTB₄. CAY10583 is a potent, selective full agonist for BLT2 with an EC₅₀ value of 20 nM. It does not displace [3H]-leukotriene B₄ (LTB₄) binding to BLT1 at concentrations >1 μM and activates BLT2 at significantly lower concentrations than LTB₄ (EC₅₀ = 170 nM). CAY10583 dose dependently increases intracellular calcium stores and induces ERK phosphorylation in Chinese hamster ovary (CHO) cells expressing BLT2 with no effect on CHO cells expressing BLT1.[1]
