

Product Data Sheet

Product Name: Avelumab (Anti-Human PD-L1, Human Antibody)

Cat. No.: GC31719

Chemical Properties

Cas. No. 1537032-82-8

SMILES [Avelumab]

Formula M.Wt 143.8 kDa

Solubility Soluble in DMSO Storage Store at -20°C

General tips For obtaining a higher solubility , please warm the tube at 37 °C and shake it in the ultrasonic bath for a while. Stock solution can be stored below -20°C for several months.

Shipping Condition Evaluation sample solution : ship with blue ice All other available size: ship with RT , or blue ice upon request.

Structure

Avelumab

Protocol

Cell experiment [1]:

Cell lines UM-Chor1 cells

Caution: Product has not been fully validated for medical applications. For research use only.

Tel: (909) 407-4943 Fax: (626) 353-8530 E-mail: tech@glpbio.com

Address: 10292 Central Ave. #205, Montclair, CA, USA

Product Data Sheet

Preparation Method UM-Chor1 cells were treated with 50ng/ml IFN- γ for 24 hours. Cells were then seeded in 6-well round-bottom culture plates at a density of 5×10^4 cells/well and incubated with 2 μ g/ml Avelumab for 30min at room temperature. Subsequently, 2.5×10^7 NK cells/well were added with a 50:1 ratio of effector cells to target cells. Four hours later, tumor cells were harvested and stained with antibodies for flow cytometry analysis.

Reaction Conditions 2 μ g/ml; 30min

Applications Avelumab treatment increased UM-Chor1 cells' sensitivity to NK-cell lysis.

Animal experiment [2]:

Animal models C57BL/6 mice

Preparation Method Tumor injection was performed by subcutaneous injection of 1×10^5 MB49 parental cells into the right shaved abdomen of C57BL/6 mice. Tumor growth was measured with a vernier caliper, and mice were randomly assigned to treatment groups 8 days after inoculation. Treatment began on day 9 with an intraperitoneal injection of 400 μ g/100 μ l of Avelumab every three days for nine days. Tumors were measured twice a week throughout the study, and tumor volume was calculated according to the following formula: volume = (width)² × (length) / 2.

Dosage form 400 μ g/100 μ l; every three days for nine days; i.p.

Applications Avelumab treatment significantly suppressed tumor growth in C57BL/6 mice bearing MB49 subcutaneous tumors and substantially improved mouse survival.

Caution: Product has not been fully validated for medical applications. For research use only.

Background

Avelumab (Anti-Human PD-L1, Human Antibody) is an intravenously (i.v.) administered fully human IgG1 monoclonal antibody (mAb)^[1]. Avelumab can inhibit the interaction between PD-L1 and PD-1 and mediate antibody-dependent cell-mediated cytotoxicity (ADCC) through retention of its native FcR, leading to the reinvigoration of effector T cells^[2]. Avelumab has been widely used to inhibit tumor progression in different tumor models and to develop novel combination therapies to enhance synergistic anti-tumor effects^[3].

In vitro, Avelumab treatment at 20µg/ml for 7 days increased IFN-γ levels and decreased IL-5 concentrations in peripheral blood mononuclear cells (PBMC)^[4]. Incubation with 2µg/ml Avelumab for 30min increased the sensitivity of IFN-γ-treated UM-Chor1 cells to natural killer (NK) lysis^[5]. Treatment with Avelumab at 2µg/ml for 24h promoted NK cell disinhibition and enhanced the cytotoxicity against HPV-positive cervical cancer cells^[6].

In vivo, Avelumab treatment, at a dose of 400µg/100µl intraperitoneally every three days for 9 days, significantly inhibited tumor growth in C57BL/6 mice bearing MB49 subcutaneous tumors and substantially improved 60-day survival^[7]. Intraperitoneal injection of Avelumab at a dose of 400µg every 2 days for one week significantly delayed MC38 tumor growth in C57BL/6 mice and increased CD8⁺ T cell frequency in mouse spleen^[8].
