

Product Data Sheet

Product Name: IPR-803

Cat. No.: GC39713

Chemical Properties

Cas. No. 892243-35-5

SMILES O=C(O)C1=CC=CC(NC2=C(C3=C4ON=C3C(N5CCCCC5)=C2)C(C6=C4C=CC=C6)=O)=C1

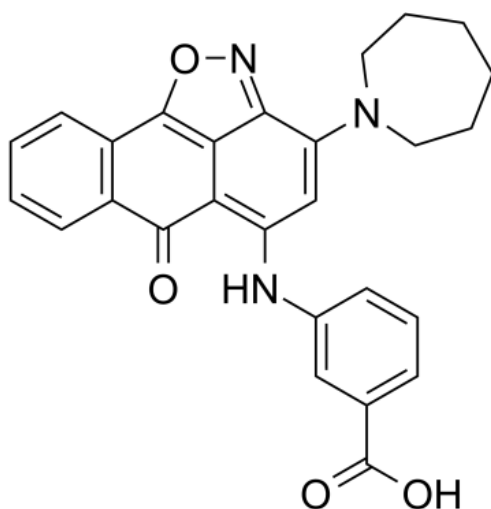

Formula $C_{27}H_{23}N_3O_4$ M.Wt 453.49

Solubility Soluble in DMSO Storage Store at -20°C

General tips For obtaining a higher solubility, please warm the tube at 37 °C and shake it in the ultrasonic bath for a while. Stock solution can be stored below -20°C for several months.

Shipping Condition Evaluation sample solution : ship with blue ice All other available size: ship with RT, or blue ice upon request.

Structure

Protocol

Cell experiment [1]:

Cell lines

MDA-MB-231 cells (human breast cancer cell line)

Caution: Product has not been fully validated for medical applications. For research use only.

Product Data Sheet

Preparation Method	MDA-MB-231 cells were treated with IPR-803, then invasion through fibronectin-coated transwell, migration by Boyden chamber and wound healing, adhesion to fibronectin/vitronectin, surface uPA/uPAR staining, and proliferation/toxicity by MTT were measured.
Reaction Conditions	0-100μM; 0.5-16h
Applications	IPR-803 reduced MDA-MB-231 invasion through membrane, showed weak/no effect on migration and no effect on adhesion, reduced surface uPA binding to uPAR, and caused concentration-dependent reduction in cell proliferation.
Animal experiment [2]:	
Animal models	Female NSG mice
Preparation Method	TMD-MDA-MB-231 cells were inoculated into the mammary fat pads of female NSG mice. Dosing was initiated at day 15 post implantation. Animals were randomized and treated with vehicle or with IPR-803 by daily oral gavage at a dose of 200mg/kg for 33 days. Tumor volumes were determined by caliper measurements on a twice weekly basis. At the end of the study, animals were sacrificed and lungs were removed for H&E staining and metastasis scoring.
Dosage form	200mg/kg; p.o.; daily for 33 days
Applications	IPR-803 impaired breast cancer metastasis to the lungs. IPR-803 had little effect on primary tumor growth and no significant effect on body weight.

Caution: Product has not been fully validated for medical applications. For research use only.

Small-Molecule Inhibition of the uPAR·uPA Interaction: Synthesis, Biochemical, Cellular, in vivo Pharmacokinetics and Efficacy Studies in Breast Cancer Metastasis. Bioorg Med Chem. 2013 Apr 1;21(7):2145-55.

Background

IPR-803 is a small molecule inhibitor of urokinase receptor (uPAR). IPR-803 competitively blocks the protein-protein interaction between uPAR and urokinase-type plasminogen activator (uPA). IPR-803 downregulates uPA expression. IPR-803 inhibits MMP-mediated extracellular matrix degradation and p-ERK/MAPK signaling. IPR-803 reduces angiogenesis and metastasis. IPR-803 is used for studying metastasis in breast cancer and pancreatic cancer^[1-4].

In vitro, MDA-MB-231 cells were treated with 0-100µM IPR-803 for 0.5-16 hours. IPR-803 inhibited cell invasion and proliferation in a concentration-dependent manner^[5]. RKO cells were treated with 30µM IPR-803 for 48-6 hours. IPR-803 inhibited phosphorylation of FAK and SLC6A8 proteins^[6].

In vivo, female NSG mice with mammary fat pad inoculation of TMD-MDA-MB-231 cells received daily oral gavage of 200mg/kg IPR-803 for 33 days. IPR-803 inhibited breast cancer cell metastasis to the lungs^[7]. Tumor-bearing nude mice with KYSE-450 cells received oral gavage of 50mg/kg IPR-803 every 3 days for 24 days. IPR-803 inhibited tumor growth^[8].
