Structure

Background

AB-CHMINACA is an indazole-based synthetic cannabinoid (CB) that is structurally related to AB-FUBINACA , a high affinity ligand of the CB1 receptor ($K_i = 0.9$ nM).[1] [2] AB-CHMINACA metabolite M2 is a potential derivative resulting from the replacement of a terminal amide NH₂ with a hydroxyl group. MA-CHMINACA is an analog of AB-CHMINACA metabolite M2 in which the hydroxyl moiety is replaced with a methyl ester group. The physiological and toxicological properties of this compound
