

Product Data Sheet

Product Name: Pembrolizumab

Cat. No.: GC19531

Chemical Properties

Cas. No. 1374853-91-4

Formula M.Wt 146266.23

Solubility Storage Store at -80°C, Avoid repeated freeze-thaw cycles

General tips For obtaining a higher solubility, please warm the tube at 37 °C and shake it in the ultrasonic bath for a while. Stock solution can be stored below -20°C for several months.

Shipping Condition Evaluation sample solution: ship with blue ice All other available size: ship with RT, or blue ice upon request.

Structure

Protocol

Cell experiment [1]:

Cell lines CAO-V-3 cells

Caution: Product has not been fully validated for medical applications. For research use only.

Address: 10292 Central Ave. #205, Montclair, CA, USA

Product Data Sheet

Preparation Method CAOV-3 cells were cultured in RPMI 1640 medium containing with 10% fetal bovine serum (FBS), and penicillin (100U/ml) and streptomycin (100µg/ml) at 37°C in 5% CO₂/atmosphere. CAOV-3 cells were seeded onto 96-well microplates (3×10³ cells/well). After incubation for 24h, cells were treated with a range of concentrations of Pembrolizumab (0, 0.5, 1, 2, 5, 10, and 20µg/ml) for 72h, cell viability was detected.

Reaction Conditions 0, 0.5, 1, 2, 5, 10, and 20µg/ml; 72h

Applications Pembrolizumab treatment decreased the cell viability of CAOV-3 cells in a dose-dependent manner.

Animal experiment [2]:

Animal models Female C57 mice

Preparation Method Female C57 mice were housed under controlled temperature (21-23°C), humidity (30-35%) and light cycle (7:00 AM to 7:00 PM) and maintained on a standard chow diet. Pembrolizumab (15mg/kg) was administered daily by intraperitoneal injection for 10 days. Cardiac levels of IL-1α, IL-1β, IL-2, IL-6 and IL-10 were quantified through ELISA method.

Dosage form 15mg/kg/day; 10 days; i.p.

Applications Pembrolizumab treatment significantly increased cardiac levels of IL-1α, IL-1β, IL-2, IL-6 in C57 mice.

Caution: Product has not been fully validated for medical applications. For research use only.

Background

Pembrolizumab is a potent, highly selective, fully humanized immunoglobulin (Ig) G4-kappa monoclonal antibody against PD-1^[1]. Pembrolizumab can disrupt the engagement of PD-1 with the related ligands and impede inhibitory signals in T cells, with resultant tumor recognition by cytotoxic T cell^[2]. Pembrolizumab has been widely used to enhance the anti-tumor immune response and increase the level of IL-2^[3].

In vitro, Pembrolizumab treatment for 72 hours significantly inhibited the viability of HO-8910 and CAOV-3 cells, with IC₅₀ values of 21.07µg/ml and 15.52µg/ml, respectively^[4]. Pembrolizumab treatment (3µg/ml) for 7 days significantly increased the secretion of IFNγ in primary non-small cell lung cancer (NSCLC) cells stimulated by anti-CD3 antibodies^[5]. Treatment with 10µg/ml Pembrolizumab for 16 hours enhanced the killing effect of αROR1-CAR T cells on A549 cells under elevated pressure^[6].

In vivo, Pembrolizumab treatment via intraperitoneal injection at a dose of 5mg/kg twice weekly for 24 days accelerated tumor growth in a colorectal cancer xenograft mouse model^[7]. Intraperitoneal injection of Pembrolizumab at a dose of 15mg/kg daily for 10 days significantly reduced cardiac pAMPK and IL-10, increased vascular NF-kB expression and levels of IL-1b, IL-2 and IL-6 in myocardial tissue of mice^[8].
